#### INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

International application No.
PCT/FR2004/002738

Вох	Box No. V Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement				
1.	Statement				
	Novelty (N)	Claims	1-6	YES	
		Claims		NO	
	Inventive step (IS)	Claims	1-6	YES	
		Claims		NO	
	Industrial applicability (IA)	Claims	1-6	YES	
		Claims		NO	

## 2. Citations and explanations (Rule 70.7)

The prior art (cf. FR2814392) is a machine for stretch blow moulding containers from thermoplastic parisons, which machine includes a continuously rotating carousel supporting at least one moulding device comprising an openable mould and a stretch rod that can be moved, under the effect of supporting and driving means, sequentially along the axis of the mould so as to stretch the parison during the container producing operation, according to the preamble of claim 1.

The problem is that of proposing an improved solution for controlling the stretch rods and thereby arriving at a smaller pneumatic facility than in the prior art (cf. description, page 3, line 9 to line 13).

The solution according to the characterising part of claim 1 is that the supporting and driving means of the stretch rod (8) are mechanical means, which include:

means for imparting movement, functionally associated with the above-mentioned carousel and capable of generating, from the continuous one-way rotational movement of the carousel, two rotary movements of given angular amplitudes of a rocker

## INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

International application No.
PCT/FR2004/002738

citations and explanations supporting such statement
that occur at two respective predetermined angular
locations of the circular trajectory of the
carousel;

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability;

- and movement transforming means for transforming the two above-mentioned rotary movements of given angular amplitudes of the rocker into two linear movements in opposite directions, alternatively downward and upward, of a drive member along a trajectory substantially parallel to the axis of the mould, said drive member being coupled to the stretch rod.

Another document, US3999927, describes a machine according to the preamble, but in this case the features "...rocker that occur at two respective predetermined angular locations of the circular trajectory of the carousel" of the movement are lacking. Hence, the solution provided by claim 1 is neither known from nor suggested by the prior art.
